For a Study Treating Old Blood Clots & Related Conditions

Have you

- Been previously diagnosed with a blood clot in your leg?
- Received prior treatment but still have leg swelling, pain or discomfort?

If so, you may be eligible to participate in the ACCESS PTS study -- which aims to evaluate the success of an advanced minimally-invasive technique in treating ‘old’ blood clots and related conditions.

Talk to your doctor today if you are interested in participating in this study.
ACCESS PTS Study

Study Treatment
The treatment provided in the study includes the use of the EkoSonic® Endovascular System — an FDA cleared device that delivers clot-busting drugs. This treatment will be provided during an overnight stay in the hospital. You will return to the doctor for 4 more outpatient visits in 12 months to monitor the effectiveness of the treatment.

About PTS
Up to 50% of patients that have a blood clot in their vein that has not been effectively treated may develop Post Thrombotic Syndrome (PTS).¹ This can result in:

• Chronic pain
• Swelling
• Discoloration
• Skin ulceration
• Significant, lasting impact on quality of life
